Program Structure and Object-Oriented Programming

An object contains: » data members : arranged as a set of named fields » methods : routines which take the object they are associated with as an argument (known as member functions in C++) » constructors : routines which create a new object A class is a construct which defines the data, methods and constructors associated with all of

Chapter 12: File System Implementation

File-System Implementation • File-system needs to maintain on-disk and in-memory structures • on-disk for data storage, in-memory for data access
• On-disk structure has several control blocks • boot control block contains info to boot OS from that volume • only needed if volume contains OS image, usually first block of volume • volume control block (eg, superbloc) contains

Object-oriented databases use small, reusable chunks of software called objects The objects themselves are stored in the object-oriented database Each object consists of two elements: 1) a piece of data (eg, sound, video, text, or graphics), and 2) the instructions, or software programs called methods, for what to do with the data
